# Comp 8005 Port Forwarder

Mat Siwoski Shane Spoor

#### Notes:

### Running the application:

To run the application, navigate to the folder that the script was installed to and type:

sudo python3 main.py

In the event that the file does not run:

chmod +x main.py chmod +x main.py

to ensure that the file can be executed.

#### Requirements:

Design and implement a port forwarding server that will forward incoming connection requests to specific ports/services from any IP address, to any user-specified IP address and port. For example, an inbound connection from 192.168.1.5 to port 80 may be forwarded to 192.168.1.25, port 80, or to 192.168.1.25, port 8005.

#### Constraints:

Your forwarder must provide the following minimum functionality:

- Forward any IP: port pair to any other user-specified IP: port pair.
- The application must support multiple inbound connection requests, as well as simultaneous two-way traffic.
- Only TCP connections will be forwarded by the basic implementation.
- You are required to provide a detailed test case that will document the complete functionality of the port forwarding application. For example, beyond the basic functionality tests you may want to test and see how well your application performs under a heavy load, i.e., heavy throughput from multiple clients.
- Your application will read the IP: port combinations to forward to from a separate configuration file. As always additional work and features will be considered for bonus marks.
- For example, a very useful feature would be to use SSL sockets

# Design:

# **Design Diagrams**

#### Pseudocode:

```
main.py
main()
       Open forwarding rules
       While True
               Set up connection
               If snat entry in snat table
                      New src port = snat_table [snat entry]
               Else if dnat entry not in dnat table
                      Dnat table = src ip and src port
                      Snat table = tcp port
                      New src port = tcp port
               Else
                      While true
                              Possible port = random port
                              Possible dnat = forward ip & port
                              If not in dnat table
                                     Srcport = possible port
                                     Update dnat/snat table
```

Forward ip/port = ip/port from rules
Set up new connection to forward too

Destination header = ip/port

Destination header = ip/port

If dnat entry not in table

Set up destination entry to send back to
